

Module 8: Conditionals & Decision Making — Practice Tasks

- Take two variables price1 and price2, and compare them using all comparison operators (==, ===, !=, !==, >, <, >=, <=), printing each result with console.log.
- Guess the result of "5" == 5 and "5" === 5 first, then write code to verify your guess.
- Create a variable isRaining (true/false). If it is true, print "Take an umbrella".
- Take a variable stock. If stock is 0, print "Out of stock" (use only if, no else).
- Take a number variable and check whether it is positive or negative (using if-else).
- Take a year variable and check whether it is a leap year (hint: year % 4 === 0).
- Take a speed variable. If speed is greater than 80, print "Overspeeding", otherwise print "Normal speed".
- Using age and hasTicket, print "Entry allowed" if age is above 18 AND the person has a ticket (use &&).
- Using isWeekend and isHoliday, print "No work today" if either one is true (use ||).
- Build a simple login system — print "Login successful" only if both username and password are correct.
- Build a grading system using a marks variable (A+, A, B, C, F) — it must have at least 5 condition branches.
- Using a bmi variable, determine the category — Underweight, Normal, Overweight, Obese (use if-else if).
- Using a month number (1-12), determine which season that month falls in (Winter, Summer, Monsoon, etc.).
- Using age and hasID, use nested if-else to check whether someone is eligible to vote.
- Using isLoggedIn and isAdmin, build a nested condition — if logged in and admin, print "Admin Dashboard"; if logged in but not admin, print "User Dashboard"; if not logged in, print "Please Login".
- Determine whether a number is even or odd using the ternary operator.

- Using age, determine "Adult" or "Minor" using the ternary operator.
 - If the price is greater than 1000, print "Expensive", otherwise "Affordable" — write this using a ternary operator.
 - Using hasPermission, use the ! operator to print "Access Denied" if permission is not granted.
 - Using isOnline, use the NOT operator to print "User is offline".
 - Build a simple discount system: if cart total is above 1000 AND the user is a member, apply a 20% discount; if only above 1000, apply a 10% discount; otherwise, no discount — use logical operators combined with if-else if.
 - Build a simple login + role-check system that verifies username/password and shows a different message based on admin/user role — combine everything from this module (comparison, logical operators, if-else, ternary).
-
